

MEEG 4103 Quiz 3.2.091

- ⑩ A plane stress state is listed to have $\sigma_x = 8 \text{ ksi}$, $\sigma_y = 16 \text{ ksi}$, and $\tau_{xy} = 3 \text{ ksi}$ (ccw). Drawing a properly labeled Mohr's circle diagram, determine (a) the principal normal stresses σ_1 and σ_2 , (b) the angle ϕ_p from the x axis to σ_1 , (c) sketch showing the principal orientation of the stress element on which σ_1 and σ_2 act.
- ⑩ For the beam shown, determine (a) the maximum tensile bending stress σ_{\max}^+ , (b) the maximum shear stress τ_{\max} due to V .

- $X(8, -3) \quad Y(16, 3) \quad \text{②}$
 $\sigma_1 = 17 \text{ ksi} \quad \sigma_2 = 7 \text{ ksi} \quad \text{②}$

 Properly labeled Mohr's circle ②
 $\phi_p = 71.6^\circ \text{ ccw} \quad \text{②}$

 Sketch showing the principal orientation of the stress element ②
- $\text{FBD, shear } (V-x) \text{ and bending-moment } (M-x) \text{ diagrams} \quad \text{③}$

 $\bar{y} = 5.75 \text{ in.} \quad \text{①} \quad \bar{I} = 281.901 \text{ in}^4 \quad \text{①} \quad \text{Pt. } D \text{ is } 5.83 \text{ ft to the left of } C.$

At B: $\sigma_{\max}^+ = \frac{15000(12)(4.25)}{281.901} \text{ psi} = 2713.7 \text{ psi} \quad \text{①}$

At D: $\sigma_{\max}^+ = \frac{10208.3(12)(5.75)}{281.901} \text{ psi} = 2498.7 \text{ psi} \quad \text{①}$

At B: $\tau_{\max} = \frac{VQ}{Ib} = \frac{5500(0.5)(5.75)^2(2.5)}{281.901(2.5)} \text{ psi} = 322.53 \text{ psi}$

 $\sigma_{\max}^+ = 2.71 \text{ ksi at } B \quad \text{①} \quad \tau_{\max} = 323 \text{ psi at } B \quad \text{②}$
